

## Life Sciences Seminar

# Reciprocal activation within a kinase-effector complex underlying persistence of structural LTP

### Yasunori Hayashi

Department of Pharmacology, Kyoto University Graduate School of Medicine, Japan

#### Host: Ryuichi Shigemoto

Long-term synaptic plasticity requires a mechanism that converts short Ca2+ pulses into persistent biochemical signaling to support the changes in the structure and function of synapses over long periods of time. Here, we present a novel type of positive feedback loop, formed by a reciprocally activating kinase-effector complex (RAKEC) in dendritic spines, enabling the persistence and confinement of the molecular memory. We found that stimulation of a single spine causes the rapid formation of a RAKEC consisting of a kinase (CaMKII) and its substrate (RacGEF Tiam1), which can stably promote actin-polymerization through Rac1, thereby maintaining the structure of the spine over a long period of time during LTP. This is achieved by a pseudo-autoinhibitory domain found within Tiam1, homologous to the autoinhibitory domain of CaMKII. The RAKEC can store biochemical information in small subcellular compartments, thus potentially serving as a general mechanism for prolonged and compartmentalized signaling.

### Monday, July 15, 2019 04:00pm - 05:00pm

Seminar Room, Lab Building East

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station. Please find a schedule of the ISTA Shuttle on our webpage: https://ista.ac.at/en/campus/how-to-get-here/ The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
