# Two types of probability measures on quantum groups

**Haonan Zhang**

IST Austria

Host: Laszlo Erdős

In this talk I will give a brief introduction to probability measures on compact quantum groups. As examples, two types of such probability measures will be discussed, the idempotent ones and the infinitely divisible ones. More precisely, we will (1) decide all the idempotent probability measures on Sekine quantum groups  $A_k$ ,  $k \geq 2$ , and give their lattice structure for  $k$  prime, which answers a question of Franz and Skalski in 2009; (2) characterise all the infinitely divisible probability measures on finite quantum groups, which recovers two results (Bge's 1959 and Parthasarathy's in 1972) from different directions.

**Thursday, November 28, 2019 04:00pm - 06:00pm**

Heinzel Seminar Room / Office Bldg West (I21.EG.101)

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.

Please find a schedule of the ISTA Shuttle on our webpage:

<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
