

## Seminar/Talk

# Transport in fractional quantum Hall edges with counterpropagating modes

**Alexander Mirlin**

Karlsruhe Institute of Technology

Host: Maksym Serbyn

Generically, edges of fractional quantum Hall (FQH) systems involve multiple modes. Furthermore, for a majority of fractions, there are counterpropagating modes on the edge. In particular, it was predicted that this is always the case for filling fractions between  $1/2$  and  $1$ , including such prominent FQH states as  $2/3$ ,  $3/5$ , etc. In this talk, I will review recent theoretical and experimental progress on understanding transport properties of such complex edges. The observables of interest include, in particular, electrical and thermal conductances. Our theory predicts distinct quantized values for them (determined by the bulk topology) for coherent (non-equilibrated) and equilibrated regimes. Another important observable is electric shot noise. We show that noise is an effective tool to study the thermal transport and the topology of the state. On the experimental side, there are major advances in the last few years in engineering such systems and exploring their transport characteristics. Combination of experimental and theoretical progress paves the way for better understanding the topology of FQH states, including non-abelian states such as  $5/2$ .

**Friday, February 3, 2023 11:00am - 12:00pm**

Heinzel Seminar Room / Office Bldg West (I21.EG.101)

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station. Please find a schedule of the ISTA Shuttle on our webpage: <https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
