

Seminar/Talk

New materials and nanostructures in and in-between graphene monolayers

Jani Kotakoski

University of Vienna

Host: Maria Ibáñez

Graphene—the one-atom-thick sheet of carbon—is the most famous of 2D materials due to its unique electronic properties and mechanical strength. However, its chemical inertness makes graphene also an excellent nearly electron-transparent support for other materials and nanostructures. In this presentation, I will give an overview of our recent work enabled by a unique interconnected vacuum system containing an aberration-corrected scanning transmission electron microscope Nion UltraSTEM 100 with a unique objective area that allows sample cleaning via laser, in situ chemical experiments, and direct vacuum transfer to an atomic force microscope (AFSEM by GeTEC Microscopy), to-and-from an argon glove box, target chamber with a plasma ion source and evaporators, and long term vacuum sample storage. In brief, I will demonstrate that defect-engineering of graphene [1] enables its substitutional heteroatom doping [2] and growth of nanoclusters with a well-defined concentration and a narrow size distribution, as well as the direct correlation of its atomic structure and mechanical properties. I will further show that graphene can be used as a support for the growth of 2D CuAu [3] and describe the first steps of the growth of Ti on graphene [4]. Finally, I will provide examples of otherwise unstable structures being stabilized in the van der Waals gap between two graphene sheets, including a mono-layer of fullerenes [5], 2D CuI [6] and small noble gas clusters [7].

Monday, June 5, 2023 11:00am - 12:00pm

Sunstone Bldg / Ground floor / Lab Meeting room I23.EG.005

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.
Please find a schedule of the ISTA Shuttle on our webpage:
<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle
(#142) and has the Institute Logo printed on the side.
