Quantitative stochastic homogenization of non-linear problems arising in mechanics

Nicolas Clozeau

ISTA

Host: Laszlo Erdős, Jan Maas

The aim of this talk is to present some recent developments in the theory of quantitative stochastic homogenization of non-linear problems arising in mechanics. In a first part, I will discuss a quantitative homogenization theory for non-linear elliptic PDEs of p -Laplacian, that can be seen as the Euler-Lagrange equation of the energy of an elastic body with random microstructure (in the case of small deformations). In particular, I will present two results : optimal rates for the convergence towards the homogenized problem; and a work in progress concerning a large-scale regularity theory for such non-linear elliptic PDEs. This is based on joint works with Antoine Gloria and Mathias Schffner. In a second part, I will move forward variational problems arising in fracture mechanics that are described by Griffith-type energies. Based on a work by Dal Maso, Scardia and Zeppieri that identifies qualitatively the effective fracture toughness by means of a cell-formula; I will present a recent result that establishes rates for the convergence of the cell-formula towards the effective quantity. This is based on a joint work with Antonio Agresti and Julian Fischer.

Monday, March 25, 2024 03:45pm - 04:45pm

Central Bldg / O1 / Mondi 2a (I01.O1.008)

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.

Please find a schedule of the ISTA Shuttle on our webpage:

<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
