

## Institute colloquium

# The Institute Colloquium: The evolution of sexual dimorphism and the effects of sex-s

**Judith Mank**

University College London

Host:

Males and females of most species share the majority of their genome, and yet they use many of their shared genes in radically different ways. This leads to conflict over optimal transcription and ultimately differences in expression levels between males and females (sex-biased gene expression). These conflicts affect the sex chromosomes and autosomes in different ways, leading to several explicit predictions about the distribution and evolution of sex-biased genes. First, individuals with elevated levels of sexual dimorphism should show exaggerated sex-biased gene expression across the genome. Second, altering sex-specific selection among populations should elicit a response in sex-biased gene expression, and this response should be more pronounced for genes linked to sex chromosomes. Third, the degree of sex-biased expression on the sex chromosomes should correlate with sex chromosome age. Case studies using both comparative and experimental evolutionary frameworks will be presented to address these predictions.

**Monday, October 12, 2015 12:45pm - 02:00pm**

Raiffeisen Lecture Hall, Central Building

This invitation is valid as a ticket for the ISTA Shuttle from and to Heiligenstadt Station.

Please find a schedule of the ISTA Shuttle on our webpage:

<https://ista.ac.at/en/campus/how-to-get-here/> The ISTA Shuttle bus is marked ISTA Shuttle (#142) and has the Institute Logo printed on the side.
